Â

Â

If you have issues with apache2 and you want to reinstall it but you are getting errors,then here it isthe solution for you.

i had an issue with apache, when i tried to start it i got this error message.

/etc/init.d/apache2Â Â start.: 45: Can't open /etc/apache2/envvars

i need to remove it completely.To do that i will use this command :

   sudo apt-get remove --purge apache2 apache2-utils This command will completely remove all apache2 configuration files and directories.
 - Reinstall again apache using the normal command sudo apt-get install apache2

check your apache2
dpkg -l | grep apache2
